

## **Wiring of Your New VL-30 Ventless Hood For Peerless C131P Oven**

The CE131P has been pre-wired to your hood at the factory. Please have a qualified electrician hook up the wires that leave the electrical box on the hood and install them on L1 and L3 on the terminal block of the oven.

The service for the entire unit goes to the electrical box on the hood. Wire a 50 amp service and run to the top of the contactor in the electrical box on the hood.

For the unit to operate, all six filters must be in place and the kill switches depressed. For a diagram on which filter goes in first, second and last, see the diagram in these pages.

To turn the unit(s) back on:

- 1) Turn on the toggle switch located on the side of the control box near the back of the hood.
- 2) Press the black reset button also located on the control panel and hold for 5 seconds.
- 3) Turn the toggle located on the front of the C131P to the "On" position.

Follow instructions located in the Peerless printed manual for additional operation instructions.
